

With Compliments

WOODLICE CARE INSTRUCTIONS

Woodlice should be kept in a well ventilated, lidded container, with a substrate of leaf litter and soil rich in humus. This should be kept cool and damp. Pieces of rotten wood or tree bark, or damp kitchen roll paper should be provided for the woodlice to congregate beneath. The main part of their diet will be from the humus, but small slices of potato or apple can be added from time to time.
