## **Brine Shrimp Adults** *Artemia*

**Housing:** Brine shrimp adults can be kept in clean empty drinks bottle (e.g. cola 2 litre bottle) with a loose lid for classroom experiments or a small aquerium for larger quantities or breeding.

**Substrate:** A thin layer of fine gravel or coral sand.

**Temperature:** Breeding will not occur readily below 25 C so between 25-30 C is best.

**Lighting:** A south facing window-sill with between 18-20 hours of daylight is ideal and this will provide enough heat in the summer months. Brine shrimp cultures dont do well in the dark.

**Water:** Any commercial sea salt can be used (ACS006 120g or ACS005 4 kg) or natural sea water if you are able to get it provided that the water is unpolluted.

**Food:** The brine Shrimp feed on both living algae Dunanliella (LZA150) or just as well on marine filter feeder diet (DTS095)
